

ABSTRACT OF THE DISCLOSURE

A wash bag assembly for washing delicate wash items having a container which defines an interior chamber. The container is constructed of a water-permeable material. A separator wall extends through the interior chamber and divides the interior chamber into a first and second subchamber. A first closure selectively provides access to the first subchamber for the insertion and removal of at least one wash item while, similarly, a second closure selectively provides access into the second subchamber for the insertion and removal of at least one wash item.
